EDUCATION

M.S., Computer Science – Interactive Intelligence, Georgia Tech, Atlanta, GA

August 2023 - August 2026

B.A., Physics, Willamette University, Salem, OR

May 2019

PROFESSIONAL EXPERIENCE

Technical Solutions Engineer – Epic Systems Corporation

December 2019 – December 2022

- Deployed, maintained, and debugged revenue cycle software, including HIPAA-mandated EDI claims and remittance transactions (837I/837P, 835), for health system clients
- Headed the Debugging Task Force; taught new hires to use internal debugging tools and revised the onboarding curriculum
- Wrote M/MUMPS database queries against production healthcare IT databases to diagnose client issues and support data analysis for issue resolution
- Coordinated large-scale claims implementations for clients, including claim attachments, PLBs, rapid reconciliation, and state reporting, helping hospitals and professional organizations meet standardized claim conformance requirements

Teacher's Assistant – Willamette University, Physics Department

January 2019 – May 2019

- Guided students through computational and experimental Introductory Physics 2 laboratory exercises
- Answered questions about class material and evaluated students' performance

Intern – Willamette University, Physics Department

May 2018 – July 2018

- Implemented 3D wavelet convolutions via FFT in Python to search for baryon acoustic oscillation (BAO) signals in the 2MASS Redshift Survey – the first application of this method to the 2MRS
- Applied Gaussian smoothing, zero-padding, and a custom local maxima detection algorithm to identify candidate BAO locations from a cosmological density field
- Built a computer for parallel GPU processing to support analysis of a large-scale cosmological dataset

PROJECTS AND RESEARCH

- **Predicting Speedrunner Retention from Activity Patterns**
Applied Machine Learning Research, 2026
 - Built an end-to-end pipeline predicting speedrunner retention, pulling data from the speedrun.com API into SQLite and engineering behavioral features (recency, frequency, consistency, run density)
 - Compared three model families (logistic regression, gradient boosting, and a PyTorch MLP) across three games, reaching ~0.79 AUC on splits controlled for temporal and identity leakage
 - **Tools:** Python, PyTorch, scikit-learn, NumPy, SQLite
- **Benchmarking Reinforcement and Imitation Learning on a Deterministic Platformer: Jump King**
Reinforcement Learning Research, 2026

- Built a full pipeline interfacing with a live commercial game through real-time state extraction (custom C# mod), TCP socket communication, and a custom Gymnasium environment
- Designed and implemented behavioral cloning (BC) from human playthroughs, per-level reward shaping, and a class-based framework for training and evaluating RL, BC, and BC+RL agents
- Chained per-level agents reliably complete the full 43-level base game in ~10 minutes
- Showed BC initialization solves levels where pure RL fails entirely, and converges far faster elsewhere
- **Tools:** Python, C#, Stable-Baselines3, Gymnasium, dnSpy, .NET
- **Looking for the BAO Signal in the 2MRS Using the Wavelet Transformation**
Cosmology Research – Senior Thesis, Willamette University, 2018-2019
 - Applied wavelet transformations to identify baryon acoustic oscillations (BAOs) in galaxy distribution data from the 2MASS Redshift Survey (2MRS)
 - Identified three BAO signals with only 0.0008% probability of occurring by chance (3.41σ)
 - **Tools:** Python, NumPy, SciPy, Matplotlib
- **Improving Students' Code Comprehension Ability Through LLM-Generated Practice Problems**
Educational Technology Research, 2025-2026
 - Built a web application generating personalized coding exercises to improve code comprehension
 - Designed and implemented a multi-model pipeline with conditional routing, prompt chaining, input validation, guardrails, and feedback loops across OpenAI and Anthropic APIs
 - **Tools:** Python, Django, JavaScript, HTML/CSS, OpenAI and Anthropic APIs
- **Schema Activation via Source Attribution: Does Labeling a Passage as AI-Authored Affect Immediate Recall?**
Cognitive Science Research
 - Investigated whether labeling a passage as AI-authored activates a source-credibility schema that affects immediate memory recall
 - Recruited 22 participants across three experimental groups exposed to identical passages attributed to different sources
 - Participants in the AI-labeled group scored nearly 17 percentage points higher on recall than other groups, suggesting low-credibility, high-skepticism schema activation

POSTERS AND PRESENTATIONS

- *Improving Students' Code Comprehension Ability Through LLM-Generated Practice Problems*
Poster Presentation – National Council on Measurement in Education (April 2026)
- *Looking for the BAO Signal in the 2MRS Using the Wavelet Transformation*
Oral Presentation – Willamette-Linfield intercollegiate symposium (May 2019)
Poster Presentations – 223rd Meeting of the American Astronomical Society (January 2019),
Murdoch College Science Research Conference (November 2018)

TECHNICAL SKILLS

- **Languages:** Python, HTML, CSS, JavaScript, SQL, M/MUMPS
- **AI & ML:** NumPy, Stable-Baselines3, Gymnasium, PyTorch, scikit-learn, OpenAI API, Anthropic API, Prompt Engineering

- **Frameworks & Tools:** Django, Git, Unity, LaTeX, C#, .NET, Android Studio, dnSpy
